1. 目录

目录

RE\	VISION HISTORY	ii
1.	目录	iii
2.	分区介绍	iv
	2.1. 分区的基本介绍:	iv
	2.2. 不同的编译 config	iv
	2.3. 对应的具体设置:	
3.	修改基本分区:	vii
	3.1. 修改基本分区名字	vii
	3.2. 修改基本分区的文件系统	viii
4.	增加扩展分区	x
	4.1. 增加扩展 ubifs 分区	X
	其他	

2. 分区介绍

2.1. 分区的基本介绍:

1. 基本分区

IPL, UBOOT, ENV, LOGO, Kernel, RECOVERY

2. 扩展分区

除开基本分区外的分区。

我们希望客户基本分区能够保持不动,只是修改扩展分区。

2.2. 不同的编译 config

以如下 config 举例:

```
/setup_config.sh configs/ipc/i6/spinand.glibc.009a.64.qfn88
jinfeng.long@ubuntu:~/i6/project$ ./setup_config.sh configs/ipc/i6/spinand.glibc.009a.64.qfn88
PROJ ROOT = /home/jinfeng.long/i6/project
CONFIG NAME = config module list.mk
SOURCE MK = .../sdk/sdk.mk
KERNEL_MEMADR = ${shell /home/jinfeng.long/i6/project/image/makefiletools/bin/mmapparser /home/jinfeng.long/i6/project/board
KERNEL_MEMLEN = $(shell /home/jinfeng.long/i6/project/image/makefiletools/bin/mmapparser /home/jinfeng.long/i6/project/boar
KERNEL_MEMADR2 = $(shell /home/jinfeng.long/i6/project/image/makefiletools/bin/mmapparser /home/jinfeng.long/i6/project/boa
KERNEL_MEMLEN2 = $(shell /home/jinfeng.long/i6/project/image/makefiletools/bin/mmapparser /home/jinfeng.long/i6/project/boa
KERNEL_MEMADR3 = $(shell /home/jinfeng.long/i6/project/image/makefiletools/bin/mmapparser /home/jinfeng.long/i6/project/boa
KERNEL_MEMLEN3 = $(shell /home/jinfeng.long/i6/project/image/makefiletools/bin/mmapparser /home/jinfeng.long/i6/project/boa
LOGO ADDR = $(shell /home/jinfeng.long/i6/project/image/makefiletools/bin/mmapparser /home/jinfeng.long/i6/project/board/$(
CHIP = i6
BOARD = 009A
BOARD NAME = SSC009A-S01A
PRODUCT = ipc
TOOLCHAIN = glibc
TOOLCHAIN_VERSION = 4.8.3
KERNEL_VERSION = 4.9.84
KERNEL_CONFIG = glibc
IMAGE_CONFIG = spinand.ubifs.hfglibc.nvr.mma
CUSTOMER OPTIONS = null_options.mk
CUSTOMER_TAILOR = ipc_i6_tailor.mk
MMAP = MMAP I6 64.h
```

从 IMAGE CONFIG:

IMAGE_CONFIG = spinand.ubifs.hfglibc.nvr.mma

2.3. 对应的具体设置:

找到: spinand.ubifs.hfglibc.nvr.mma 文件

{Product Description} {Document Name + Version}

关于重点关键字的介绍:

IMAGE_LIST = ipl uboot logo kernel rootfs nvrservice customer

表示有哪些分区。

Ipl: 包括 ipl/ipl cust (放在一起的原因是:对于烧录来说,它们是在一起烧录的) 它主要用来配置 cpu frequency 等;

Uboot: 用来烧录 uboot Logo: 用来烧录 logo

其他

若需要新增加一个分区如 aaa 分区: 需要在 IMAGE_LIST 后面添加 aaa 分区。

BUSYBOX = busybox-1.20.2-arm-linux-gnueabihf-glibc

Busybox 有做成动态的和静态的,可以根据该名字找到对应的 busybox 动态的 busybox:

系统启动的 init 进程的时候,会去找 linuxrc ,因为是动态的,会去 libc 下找相关的库文件。

MTDPARTS =

 $\label{local-control} $$ \mbox{"mtdparts=nand0:0x60000@0x140000(IPL0),0x60000(IPL1),0x60000(IPL_CUST0),0x60000(IPL_CUST1),0x6$

这个表示系统真正的分区, 可以在 uboot 当中通过 mtdparts 看到:

这一衣小东坑真正的方色, 可以在 uboot 当中通过 mtupatts 有到:									
MStar # mtdparts									
device nand0 <nand0></nand0>	, # parts = 11								
#: name	size	offset	mask_flags						
0: IPL0	0x00060000	0x00140000	0						
1: IPL1	0x00060000								
2: IPL_CUST0	0x00060000	0x00200000	Θ						
3: IPL_CUST1	0x00060000	0x00260000	Θ						
4: UB00T0	0x000c0000	0x002c0000	Θ						
5: UB00T1	0x000c0000	0x00380000	Θ						
6: ENV	0x00060000	0x00440000	Θ						
7: L0G0	0x00120000	0x004a0000	Θ						
8: KERNEL		0x005c0000	Θ						
9: RECOVERY	0x00500000	0x00ac0000	Θ						
10: UBI	0x07040000	0x00fc0000	Θ						
active partition: nand0,0 - (IPL0) 0x000600000 @ 0x00140000									
<pre>defaults: mtdids : nand0=nand0 mtdparts: mtdparts=nand0:0xC0000@0x140000(NPT),-(UBI)</pre>									
MStar #									

如前面提到的:

若要增加一个 aaa 的 squshfs 分区,需要在上述的 MTDPARTS 当中添加对应的 aaa 分区。

{Product Description} {Document Name + Version}

```
nvrservice$(RESOUCE) = $(OUTPUTDIR)/tvconfig/config
                    = ubifs
nvrservice$(FSTYPE)
nvrservice$(PATSIZE) = 0x2000000
nvrservice$(MOUNTDIR) = /tvconfig
nvrservice$(OPTIONS) = rw
```

若要把 nvrservice 分区改成 squashfs ,可以做如下修改:

a.

```
nvrservice$(FSTYPE) = ubits
-nvrservice$(FSTYPE) = squashfs
nvrservice$(RESOUCE) = $(OUTPUTDIR)/tvconfig/config
nvrservice$(PATSIZE) = 0x2000000
-nvrservice$(MOUNTDIR) = /tvconfig
-nvrservice$(OPTIONS) = rw
+nvrservice$(MOUNTDIR) = ubi.mtd=12,2048
+nvrservice$(MTDPART) = $(nvrservice$(PATSIZE))(nvrservice),
```

b. 修改 MTDPARTS

3. 修改基本分区:

3.1. 修改基本分区名字

Exampel:

把 nvrservice 改名为 usbcam_config

修改如下:

2. 修改对应路径的 rootfs.mk 文件

找到: mount -t ubifs ubi0:nvrservice /config >> \$(OUTPUTDIR)/rootfs/etc/profile; 改成: mount -t ubifs ubi0:usbcam_config/config >> \$(OUTPUTDIR)/rootfs/etc/profile;

修改结果如下:

```
# df
                     1K-blocks
                                     Used Available Use% Mounted on
Filesystem
                                               2480 80% /
ubi:rootfs
                         12268
                                     9788
                        121840
                                       Θ
devtmpfs
                                             121840
                                                      0% /dev
                        121840
tmpfs
                                        0
                                             121840
                                                      0% /tmp
var
                        121840
                                       Θ
                                             121840
                                                      0% /var
mdev
                        121840
                                       Θ
                                             121840
                                                      0% /dev
                                                      0% /customer
                                       20
ubi0:customer
                         42316
                                              42296
ubi0:usbcam_config
                         27752
                                     9896
                                              17856
                                                     36% /config
```

{Product Description} {Document Name + Version}

3.2. 修改基本分区的文件系统

Example:

要修改 nvrservice 分区为 squshfs (由 ubifs -> squshfs)

修改如下:

1. 修改烧录的打包脚本:

找到对应目录的 script_nand.mk 文件,做如下修改(这个部分已经修好):

(需要补这部分,不然编译打包过程中会由 error)。

- 2. 修改 spinand.squashfs.hfglibc.nvr.mma 文件(最好另外建立命名一个文件)
 - a. 修改 MTDPARTS

修改前:

MTDPARTS =

 $\label{localization} $$ \mathbf{UBOOT0},0x60000@0x140000(IPL0),0x60000(IPL1),0x60000(IPL_CUST0),0x60000(IPL_CUST1),0xC0000(UBOOT0),0xC0000(UBOOT1),0x60000(ENV),0x120000(LOGO),$$ (kernel$(MTDPART))$$ (mTDPART)-(UBI)"$

修改后:

MTDPARTS =

"mtdparts=nand0:0x60000@0x140000(IPL0),0x60000(IPL1),0x60000(IPL_CUST0),0x60000(IPL_CUST1),0xC0000(UBOOT0),0xC0000(UBOOT1),0x60000(ENV),0x120000(LOGO),\$(kernel\$(MTDPART))\$(rootfs \$(MTDPART))*(nvrservice*(MTDPART))*

b. 修改文件系统:

```
nvrservice$(RESOUCE) = $(OUTPUTDIR)/tvconfig/config
-nvrservice$(FSTYPE) = ubifs
+nvrservice$(FSTYPE) = squashfs
nvrservice$(PATSIZE) = 0x2000000
-nvrservice$(MOUNTDIR) = /tvconfig
-nvrservice$(OPTIONS) = rw
+nvrservice$(MOUNTDIR) = ubi.mtd=12,2048
+nvrservice$(MTDPART) = $(nvrservice$(PATSIZE))(nvrservice),
```

c. 修改 rootfs.mk 文件:

{Product Description} {Document Name + Version}

找到: mount -t ubifs ubi0:nvrservice /config >> \$(OUTPUTDIR)/rootfs/etc/profile;

改成: mount -t squashfs /dev/mtdblock11 /config >> \$(OUTPUTDIR)/rootfs/etc/profile;

{Product Description} {Document Name + Version}

4. 增加扩展分区

4.1. 增加扩展 ubifs 分区

Example:

增加扩展分区 abcde

修改如下:

1. 修改 IMAGE_LIST:

IMAGE_LIST = ipl uboot logo kernel rootfs usbcam_config customer abcde

2. 增加 abcde 分区:

```
+abcde$(RESOUCE) = $(OUTPUTDIR)/abcde
+abcde$(FSTYPE) = ubifs
+abcde$(PATSIZE) = 0x500000
+abcde$(MOUNTDIR) = /abcde
+abcde$(OPTIONS) = RW
```

3. 修改结果如下:

J.					
/ # df					
Filesystem	1K-blocks	Used	Available	Use%	Mounted on
ubi:rootfs	12268	9788	2480	80%	/
devtmpfs	121840	0	121840	9%	/dev
tmpfs	121840	Θ	121840	9%	/tmp
var	2980	24	2956	1%	/var
mdev	121840	Θ	121840	O%	/dev
ubi0: ustomer	27752	20	27732	O%	/customer
ubi0:usbcam config	27752	9896	17856	36%	/config
ubi0:abcde	2980	24	2956	1%	/var
/ #					
_					

{Product Description} {Document Name + Version}

5. 其他

1. 烧录脚本介绍:

project/image/output/images/scripts 路径下。

可以详细看怎么烧录的。

其中: set_config 用于设置 bootargs 等; [[set_partition.es 用于在 flash 上设置分区;

2. 烧录脚本生成:

image/configs/i2/rootfs.mk

3. 其他介绍:

GCIS.bin:

用于配置 flash 基本设置;

Ipl.bin:

用于设置 cpu freq 等

Other:

待补充;
